Ist strand cDNA was prepared from 12 pooled bulk tumor samples and primed with a Not I - oligo(dT) primer.
Double-stranded cDNA was ligated to Eco RI adaptors
(Pharmacia), digested with Not I and cloned into the Not and Eco RI sites of the modified pT713 vector. Library went through one round of normalization. "
350-550 bp. The 3' specific fragments were selected by streptavidin coated magnetic beads, ligated to non-palindromic BarXI adapters, Not1 digested and directionally cloned into BstXI-Not1 cut pcDNAII vector."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Eukaryota, Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

RescueMu is a 49 kb, modified maize Mu transposen

designed to allow plasmid rescue from total genomic DNA.

Mu elements insert preferentially into transposen

designed to allow plasmid rescue from total genomic DNA.

Mu elements insert preferentially into transposen

units. For more information on RescueMu, go to the web

site 'www.zmdb.iastate.edu' and follow the links for

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Description

This invention describes a novel biochip comprising probe spots, each containing many identical probes. The probes are nucleotide sequences of 20-80 bases, are prepared ex situ from synthetic oligonucleotides and at least 20 bases identical with, or least one includes a segment of at least 20 bases identical with, or complementary to, a segment of an open reading frame (orf) of Escherichia occil X12. The biochip is used for specific detection of gene expression in X12 and for determining the gene expression pattern, e.g. for diagnostic determination of which E. coli strains are present in the gut, and to determine the effects of e.g. growth media on gene expression. The blochip provides as comprehensive as possible detection of the X12 cand to determine the effects of many different genes with a single device, and comparison of gene expression between X12 and its mutants or other E. coli strains in a single experiment. Apart from qualitative and quantitative information about gene expression, it also allows measurements of population densities for the various strains. The use of synthetic oligonucleotides for preparation of probes allows free containing in probe length and ensures high purity (and thus selectivity, reactivity and reproducibility); also synthetic probes are generally
                                                                                                                                                                                                                                                                                                ö
           evolution of 11gands by exponential enrichment (SELEX). A single stranded DNA pool was incubated with U251 cells, and the tighter binding sequences partitioned from the rest of the pool by filtering the reaction through nitrocellulose filters. Twenty rounds of selection were carried out, using a decreasing concentration of U251 cells as the SELEX progressed. Ligands to glioblastoma cell lines can be used in vivo to image other attached therapeutic localisation of the ligand or

The probes are nucleotide sequences of 30.80 bases, are prepared ex situ from synthetic oligonucleotides and at least one includes a segment of at least 20 bases identical with, or complementary to, a segment of an open reading frame (orf) of Escherichia coli K12. The biochip is used for specific detection of gene expression diagnostic determination of which E. coli strains are present in the gut, and to determine the effects of e.g. growth media on gene expression. The blochip provides as comprehensive as possible detection of the K12 plochip provides as comprehensive as possible detection of the subjective denome, with almultaneous analysis of many different genes with a single device, and comparison of gene expression between K12 and its mutants or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      other B. coli strains in a single experiment. Apart from qualitative and quantitative information about gene expression, it also allows measurements of population densities for the various strains. The use of synthetic oligomucleotides for preparation of probes allows free variation in probe length and ensures high purity (and thus selectivity, exactivity and reproducibility); also synthetic probes are generally shorter than probes prepared by polymerase chain reaction. ACD68731 to ACD81540 represent oligomucleotide probes used with the biochip described

The aptamers comprises a nucleotide sequence selected from SEQ ID NOS 13-65, 71-88, 91-96, 103-118, 124-134, 135-159, 162, 164-172, 176-178, 181-196, and 199-314. Also described are: (1) a pharmaceutical composition comprising an aptamer selected from one cited above, or its salt, and a pharmaceutical carrier or diluent; (2) a method of treating, preventing, or ameliorating a disease mediated by IL-23; (3) a method of treating, preventing, or ameliorating a meliorating a disease mediated by IL-12; and (4) a diagnostic method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 'note = "All purines are deoxy and all pyrimidines are 2'-

           inflammatory disease (e.g. Crohn's Disease or ulcerative colitis), cancer (e.g. colon cancer, lung cancer, or lung metastases), bone resorption in osteoporosis, or Type I Diabetes. This sequence represents an aptamer of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            5, -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to aptamers that specifically bind to interleukin-
23 (II-23) or interleukin-12 (II-12), or their variants. The aptamers
comprises a nucleotide sequence selected from SEQ ID NOS 13-66, 71-88, 9-
96, 103-118, 124-134, 135-159, 162, 164-172, 176-178, 181-196, and 199-
314. Also described are: (1) a pharmaceutical composition comprising an
aptamer selected from one cited above, or its salt, and a pharmaceutical
carrier or diluent; (2) a method of treating, preventing, or ameliorating
                                                                                                                                                                                                                                                                                                                                                                                                                        autoimmune disease; inflammation; câncer; bone resorption; osteoporosis; insulin dependent diabetes; immunosuppressive; antiinflammatory; cytostatic; osteopathic; antidiabetic; neuroprotective; antizheumatic; antidiabetic; neuroprotective; antizheumatic; antidathritic; dermatological; gastrointestinal-gen;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New aptamer that specifically binds to IL-23 or its variant, useful for treating, preventing, or ameliorating, e.g. autoimmune disease, inflammatory disease, cancer, bone resorption in osteoporosis, or Type I
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /note= "All purines are deoxy and all pyrimidines are O-methyl"

                                                     IL-23 or its variant. The aptamers of the invention are useful as in vitro or in vivo diagnostic agents. They are also useful in the treatment, prevention, or ameliocation of a disease in vivo. The disease is an autoimmune disease (e.g. multiple sclerosis, rheumatoid arthritis, psoriasis, systemic lupus erythematogus, or irritable bowel disease), inflammatory disease (e.g. Crohn's Disease or ulcrative colitis), cancer (e.g. colon cancer, lung cancer, or lung metastases), bone resorption in osteoporosis, or Type I Diabetes. This sequence represents an aptamer of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Identification of ligands to basic fibroblast growth factor and thrombin - which can be modified for increased in vivo stability.
a disease mediated by IL-23; (3) a method of treating, preventing, or ameliorating a disease mediated by IL-12; and (4) a diagnostic method comprising contacting an aptamer above with a composition suspected of comprising IL-23 or its variant and detecting the presence or absence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequences given in AAQ98397-405 represent DNA ligands directed to

          exponential enrichment (SELEX). Two populations of single stranded (88) DNA molecules with either 30N or 60N variable regions with 5' and 3' lixed regions were synthesised. Thrombin and DNA were incubated in a buffer at 37 deg.C for 5 mins. The thrombin and DNA is removed by filtration. A double stranded product was created and amplified by PCR, and a sBDNA template pool was isolated from this by alkaline denaturation. This sBDNA template pool was used for the following round of SELEX. Individual clones were isolated and the dissociation constants from 0.9-2.5 nM for the 60N DNA's. A truncated ligand given in AAQ98404 was derived form the high affinity clone 60-18 and has a Kd of 1.9 nM and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a purified and isolated non-naturally occurring DNA ligands to basic fibroblast growth factor (bFGF). The ligands are useful as part of gene therapy treatments and for diagnosing pathogenesis of vascular diseases including initiation and properssion of atherosclerosis, acute coronary syndromes, vein graft disease and restenosis following coronary angioplasty. The ligands have improved stability in vivo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ligand; basic fibroblast growth factor; bFGF; gene therapy; vascular; atherosclerosis; angioplasty; stability; ss.
thrombin which were isolated using systematic evolution of ligands by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel nucleic acid ligands to basic fibroblast growth factor that are useful as inhibitors of basic fibroblast growth factors and 2'-amino modified RNA ligands, exhibit increased in vivo stability.
                                                                                                                                                                                                                                                                                                            Gaps

This invention describes a novel biochip comprising probe spots, each containing many identical probes. The probes are nucleotide sequences of 30-80 bases, are prepared ex situ from synthetic oligonucleotides and at least one includes a segment of at least 20 bases identical with, or complementary to, a segment of at open reading frame (orf) of Escherichia complementary to, a segment of an open reading frame (orf) of Escherichia and for determining the gene expression pattern, e.g. for diagnostic determining the gene expression pattern, e.g. for and to determine the effects of e.g. growth media on gene expression. The biochip provides as comprehensive as possible detection of the K12 genome, with simultaneous analysis of many different genes with a single device, and comparison of gene expression between K12 and its mutants or other E. coli strains in a single experiment. Apart from qualitative and quantitative information about gene expression, it also allows measurements of population densities for the various strains. The use of synthetic oligonucleotides for preparation of probes allows free
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Biochip containing probes complementary with open reading frames in

This invention describes a novel biochip comprising probe spots, each containing many identical probes. The probes are nucleotide sequences of 30-80 bases, are prepared ex situ from synthetic oligonucleotides and at least one includes a segment of at least 20 bases identical with, or complementary to, a segment of an open reading frame (orf) of Escherichia coll K12. The biochip is used for specific detection of gene expression in K12 and for determining the gene expression pattern, e.g. for diagnostic determination of which E. coll strains are present in the gut, and to determine the effects of e.g. growth media on gene expression. The biochip provides as comprehensive as possible detection of the K12 genome, with simultaneous analysis of many different genes with a single device, and comparison of gene expression between K12 and its mutants or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Biochip containing probes complementary with open reading frames in
Bscherichia coli K12, useful for detecting gene expression and expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                reactivity and reproducibility); also synthetic probes are generally
shorter than probes prepared by polymerase chain reaction. ACD68731 to
ACD81540 represent oligonucleotide probes used with the biochip described
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           other B. coll strains in a single experiment. Apart from qualitative and quantitative information about gene expression, it also allows measurements of population densities for the various strains. The use of synthetic oligomucleotides for preparation of probes allows free variation in probe length and ensures high purity (and thus selectivity,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 AGCTGCCCTCCTCTCTCCCCTCACTACAGCCCTGGTGGGGGGAGAAGGGGGTGG 56
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         28 AACTGGCCTGCTTTCCTCCTCTGCCGCTTCAGGCGTGCCGCAGAGAATCTGG 83

The invention relates to a purified nucleic acid molecule associated with catcation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 15112 nucleotide sequences, appearing as ABX34835-ABX4947, or complements of them. Also included are illused to a promoter and a 3 non-translated sequence that the cell to cause termination of transcription and addition of polyadenylated ribonucleotides to a 3' end of the mRNA molecule; and comprising a level or pattern of a molecule in a bovine cell or tissue comprising; (a) incubating a marker nucleic acid (comprising any of the 15112 nucleic acid sequences or its complement or fragment) with a complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid permits the detection of the molecule; and (b) detecting the level or pattern of the complementary nucleic acid permits the detection of the molecule; and complementary nucleic acid permits the detection of the complementary nucleic acid sequence to the detection of the molecule; and (b) detecting the level or pattern of the complementary nucleic acid is predictive of the complementary nucleic acid is predictive of the complementary nucleic acid is predictive of the complementary nucleic acid is breafted for determining a level or pattern of a molecule in a bovine cell or tissue. Complementary nucleic acid is predictive of the molecule. The inflation of a molecule in a bovine cell or the complementary nucleic acid is nucleic acid is predictive of the complementary nucleic acid is nucleic acid is predictive of the molecule in a bovine cell or the molecule in a bovine cell or the molecule or pattern of the molecule in 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acid associated with lactation, and muscle and fat deposition, useful for genome mapping, gene identification and analysis, cattle breeding, or for genetically improving cattle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        15112 bowine LMFD EST (expressed sequence tag) nucleic acids. Note: The present sequence was not shown in the specification but was obtained in electronic format from the USPTO web site:

The present invention relates to novel methods for constructing fungal strains useful for identification and validation of gene products as targets for therapeutic agents, for creating a collection of identified especial genes, and screening assays for the discovery of new drugs. The invention provides the GRACE (gene replacement and conditional expression) method for the construction of mutant organisms referred to as GRACE strains of the construction of mutant capanisms referred to organism, particularly a pathogenic fungus e.g. Candida albicans, Aspergillus fungatus and Cryptococcus necformans. The methods are useful to identify agents that may be used in the treatment of fungal infections. AAS23441-AAS23503 represent C. albicans essential gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             infections. AAS23443-AAS23503 represent C. albicans essential gene knockout upstream PCR primers (KO-Up) used in the methods of the present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from mucleic acid probes for measuring gene expression in a sample derived from much breast and BT 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label bound to each probes are useful for verifying the capteriary. The probes are useful for verifying the capteriary of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this contaction forms forms and dispersion, with a printed specification, but was obtained in the dispersion of the printed specification, but was obtained and a sequence of the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                               New spatially-addressable set of single exon nucleic acid probes, useful for measuring gene expression in sample derived from human breast, comprises number of single exon nucleic acid probes.

probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nuclease; tagged protein; protein production; glutathione S transferase;

                                                                                                                                                                                                             The invention relates to producing full-length proteins incorporating alpha-S-dNTPs and dNTPs into DNA (I) encoding protein, protecting ends of (I) from nuclease digestion, generating (I) in which set of nested deletions are generated and 5 or 3 untranslated region (UTR) of open reading frame (ORF) are removed, by nuclease digestion, cloning fragments into vector having coding sequence for 5/3 marker moiety, and expensed proteins. An array comprising proteins prepared by the above method is useful for screening one or more compounds for biological corporations or more proteins for specific protein-protein interactions or protein-protein interactions or protein-protein in the rapid corporations or more proteins of mithodies) which recognize each protein in the rapid screening of a protein, compound or nucleic acid, and also for screening of the more protein and other protein and other array. The tagged proteins produced by the methods are useful for analysis of interaction and finity chromatography of, interacting proteins, immobilisation on an affinity chromatography of, interacting proteins, base of compounds; in the immobilization by affinity purification by affinity purification by antibodies as a diagnostic tool, as a probe for CDNA microarray for identifying DNA binding proteins; or for elucidating the compounds or continually of proteins; where mass spectrometric analysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             of expressed protein components of source library or start material modified by the methods, are performed. The antibody arrays produced using (I) are useful for screening of protein function or abundance. The
                                                                                   Producing proteins having full-length, correctly folded domains and marker moiety-tagged N- or C-terminals, by genetically modifying cDNA to encode individual protein having marker moiety fused to N- or C-terminus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DNA encoding polyasparagine, hexahistidine fusion peptide (Asn-His tag).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /partial

The method of the invention involves cloning and expressing one or more proteins as full length proteins, which are each tagged at either the N- or C-terminal with a marker group. The method is useful for providing or generating an array. The array is useful in the rapid screening of a compound, protein or mucleic acid, and in screening for molecules that recognise each protein in the array, where the molecules are preferably antibodies. The present nucleic acid sequence encodes the polyasparagine hexanistidine fusion peptide of the invention. The peptide contains a histidine tag followed by an amber stop codon which is then followed by the gene encoding the green fluorescent protein (GFP) of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Samaddar M, Mulder MA, Kozlowski RZ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Method for generating a protein array for the rapid screening of a compound, protein or nucleic acid, comprises cloning and expressing protein(s) as full length protein(s), which are tagged with a marker group at either the N- or C-terminal.

Publication No. US20060183131A1

GENERAL INFORMATION:
APPLICANT: Compugen 1td
APPLICANT: Compugen 1td
TITLE OF INVENTION: UNVEL NUCLEOTIDE AND AMINO ACID SEQUENCES, AND ASSAYS AND METHODS
TITLE OF INVENTION: THEREOF FOR DIAGNOSIS OF BREAST CANCER
FILE REFERENCE: 1847.1004
CURRENT APPLICATION NUMBER: US/11/043,842
CURRENT FILING DATE: 2005-01-27
NUMBER OF SEQ ID NOS: 1028
SEQ ID NO 176
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       NAME/KEY: modified base CACATION: (1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1)...(1

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Description
